ж
Э
Mouse retinoid X receptor (RXR) interacting protein RIP13 (AAR99738) is a candidate transcriptional co-activator. It was identified using an in vivo interaction trap system for the isolation of proteins that physically interact with RXRs, esp. with the ligand binding domain of human RXR alpha. Recombinant RIP13 can be obtd. using a cDNA clone (AAT31931) obtd. from a mouse liver library. RIPs (see also AAR99735-37 and AAR99739) can be used to modulate or mediate RXR function, and may be used therapeutically or to raise antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2116

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              i.e. silencing mediator (co-repressor) for retinoic acid receptor (RAR) and thyroid hormone receptor (TR). Its association with RAR and TR both in solution and on DNA response elements is destabilised by ligand. The interaction of SMRT with mutant receptors correlates with the transcriptional silencing activities of receptors. In vivo, SMRT functions as a potent co-repressor. A GAL4-dependent reporter. These data identify a novel class of cofactor which is believed to represent an important mediator of hormone action. Full-length cDNA for SMRT has been isolated from a Hea library in a two-hybrid screen using a GAL4 DNA binding domain/RXR fusion protein as bait.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1157 SIPSLRGSITQGTPALPQTGIPTEALVKGSISRMPIEDSSP--EKGREEAASKGHVIYEG

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; caquences have activities such as: cytostatic; hepatotropic; vulnerary; contingentic; antiparkinsonian; noctropic; neuroprotective; cateopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, confidential and nucleic acids may be used to treat cancers, graft vs host disease, cardiovacular disease, diabetes mellitus, graft vs host disease, cardiovacular disease, storage, systemic lupus hypothyroidism, cholesterol ester storage, 129; cardiovascular disease; diabetes mellitus; hypothyroidism; SCID; AIDS; cholesterol ester storage; systemic lupus erythematosus; infection; severe combined immunodeficiency; malaria; autoimmune disorder; asthma; allergy; aplastic anaemia; noctural haemoglobinuria; burn; wound; bone damage; cartilage damage; antiinflammatory disease; coagulation; erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance 158 SPIS------GQPCGDDQNASPSKLSKEELIQSMDRVDREI-AKVEQQILKLKKK 205 ----spk 793 Gaps 99 -VDHDSLESKRPRLEQVSDSHFQRVSAAVLPLVHPLPEGLRASADAKKDPAFGGKHEAPS 157 EVSQASQLLQQQQQQLR-----RRPSLLSEFHPGSDRPQERRTSYEPFHPGPSP--- 98 × neurodegenerative disorder; osteoarthritis; graft vs host disease; evqskkpipskpqlkqlqvlddqgperedvrknycslrdetperksgqekshsvnteeki Indels 814; Length 3266; peptides derived from open reading coagulation; to inhibit thrombosis; and as a contraceptive. disorders, <del>=</del> = = useful for treating e.g. cancers, proliferative disordeneurodegenerative disorders and cardiovascular disease Conservative 312; Mismatches 1034; Score 520; DB 21; Pred. Novel human prostate cancer marker gene termed as 07CG27 gene, useful for screening mutations in the gene in diagnosis of a predisposition to cancer - \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides the protein and coding sequences of the human 07CG27 oncogene. This gene is found at the HPC1 region of chromosome 1. The sequences can be used in the diagnosis and identification of treatments for prostate cancer. The present sequence the 07CG27 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             128;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel oligoribo- or oligodeoxyribonucleotide, characterized in that, it hybridizes to mank that encodes protein Ki-67 at a physiologically acceptable salt concentration. The oligoribo- or oligodeoxyribonucleotide which is complementary to Ki-67, a protein active at all stages of the cell cycle except G.0, is useful for therapy of illnesses with increased cell proliferation and particularly for treatment of tumors, autolmnume diseases, scar formation, inflammation, allergy, rheumatic diseases and defence against transplantation. This sequence represents the human cell cycle protein Ki-67 which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SPVDHDSL------ESKRPRLEQVSDSHFQ-RVSAAVLPLVHPLPEGLRASA- 141

TR-interacting proteins physically associate with thyroid hormone receptor. Nearly all the fusion cDNAs showed very strong dependence on hormone activation. The proteins can be used in an in vivo trap system for the isolation of proteins which associate with any nuclear hormone receptor. The proteins and Abs may be used to treat or diagnose thyroid disorders; and to modulate thyroid hormone receptor activity.

```
This sequence represents a human thyroid hormone receptor (TR-interacting protein) which is found to interact with a novel human Jil protein in an in vivo interaction trap assay. The Jil protein is potentially useful for the treatment of hyperthyroidism or thyroid disorders.
                                                                                                                                                                          Thyroid hormone receptor-interacting protein; TR-interacting protein; JL1; human; interaction trap assay; treatment; thyroid disorder; S243b;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2231 PGTEIFNLPAVTTSGSVSSRGHSFADPASNLGLEDIIRKALMGSFDDKVEDHGVVMSQPM 2290

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention provides a JL1 protein which specifically interacts with a thyroid hormone receptor in an in vivo trap assay. The Jl1 protein can be recombinantly produced by standard recombinant methodology. The JL1 protein is used in a trap assay for determining whether a test protein is capable of interacting with a nuclear hormone receptor protein and any also be used as a therapeutic peptide for treating thyroid disorders. Sequences AAY40572-596 represent partial amino acid sequences of thyroid hormone receptor (TR)-interacting proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2231 PGTEIFNLPAVTTSGSVSSRGHSFADPASNLGLEDIIRKALMGSFDDKVEDHGVVMSQPM 2290

                                                                                                                                                                                                                                      The present sequence represents thyroid hormone receptor-interacting protein 8243b. The protein was identified using the method of the invention. The method is used to determine if a test protein is capable of interacting with a nuclear hormone receptor protein in a ligand-dependent manner. The method is used especially to screen for proteins that interact with thyroid hormone receptors in a ligand-dependent or ligand-sensitive manner.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   gene associated with tumorigenesis, found on chromosome 5q.
The sequence may be mutated by deletions insertions, inversions, or
point mutations of the gene. The APC gene is expressed in most normal
tissues as well suggesting that APC is a tumour suppressor.

                      The present sequence is the human adenomatous Polyposis coli (APC) gene product, which was used in the development of a novel method of diagnosing or prognosing an APC gene associated neoplastic issue. The method comprises comparing APC gene coding sequences or mRNA in a tumour tissue, where a difference indicates an APC gene associated neoplastic tissue, where a difference indicates an APC gene associated neoplasia of the tumour tissue.

APC is a tumour repressor expressed in most normal tissues. APC mutations are found in familial adenomatous polyposis and sporadic colorectal cancer patients. The method enables mutations to be detected to provide an indication of predisposition to cancer.

The method comprises comparing APC gene coding sequences or mRNA in a tumour tissue, to APC gene coding sequences or mRNA in a non-neoplastic tissue, where a difference indicates an APC gene associated neoplasia of the tumour tissue.

APC is a tumour repressor expressed in most normal tissues. APC mutations are found in familial adenomatous polyposis and sporadic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antibodies to normal and mutant adenomatous polyposis coli proteins

coli (ARC) gene, it encodes the tumour repressors described in AAR63507 and AAR63508. Determination of alterations in APC or its expression products, can be used for the diagnosis and prognosis of cancer e.g. colorectal, lung and breast tumours; and for determining predisposistion to certain cancers such as familial adenomatous polyposis (FAP) and canners such as familial adenomatous polyposis (FAP) and canners such as familial adenomatous polyposis (FAP) and canners as syndrome. The wild type APC gene (or a part of it) can be used the tapeutically to restore gene function, while primers and probes detect mutations. Also APC proteins or analogues can be administered to compensate for a defective gene, and epithelial cells, or transgenic animals carrying a mutated APC allele are useful for detecting therapeutic agents able to suppress tumorigenesis.

                                                                                                                                                                                                                                                                                                                                                                                              Antibodies prepared to this protein are used for detecting mutations in the APC gene for predicting pre-disposition to cancer, particularly colon cancer. The Abs can detect germ line or somatic mutations indicating a predisposition to colon cancer and possibly gastric, oesophageal, pancreatic or small cell lung cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               981 psiesyseddeskfcsyggypadlahkihsanhmddndgeldtpinyslkysdeglnsgr 1040

The invention relates to a novel method for detecting Adenomatous Polyposis Coli (APC) protein in a sample. The method involves contacting the sample with antibodies which specifically binds to the contacting the sample with antibodies which specifically binds to the protein, and detecting an APC-antibody complex. Mutations in the APC gene play a role in tumorigenesis, indicating that it is a tumour suppressor gene. It is located on chromosome 5q21, which corresponds to thousands of adenomatous polyposis) locus. FAP is an autosomal dominant inherited disease in which affected individuals develop hundreds to thousands of adenomatous polyps in the colon and rectum, some of which progress to malignancy. The FAP locus is often found to be deleted in sporadic (i.e., non-familial) adenomas and carcinomas, and chromosome 5q deletions have also been observed in tumours of the lung, breast, colon, rectum, bladder, liver, sarcomas, stomach, and prostate, and in leukaemias and lymphomas. Although the FAP locus contains several other genes such as FER, TB1, TB2, and MCC, it is thought that mutations in the APC gene play a key role in the development of FAP and sporadic tumours. The method is useful for detecting APC protein and its mutations in foreatl tissue, placental tissue, amnibiotic fluid, blood, serum or a tumour sample. The method is useful for diagnosing or prognosing neoplastic tissue, for detecting a genetic predisposition to cancer, for detecting germline and somatic alteration of wild-type APC genes, and for testing therapeutic agents for the ability to suppress tumours. The present sequence represents a 2742 amino acid splice our cancer, and the human APC protein. This variant is less abundant than the contains the contains.

Determination of activations at an extraction products, can be used for the diagnosis and prognosis of cancer e.g. colorectal, lung and breast tumours; and for determining predisposistion to certain cancers such as familial adenomatous polyposis (FAP) and Gardner's syndrome. The wild type APC gene (or a part of it) can be used therapeutically to restore gene function, while primers and probes derived from the CDNA (AAQ72333-400 and AAQ72541-568) can be used to compensate for a defective gene, and epithelial cells, or transgenic animals carrying a mutated APC allele are useful for detecting therapeutic agents able to suppress tumorigenesis.
                                                                                                                                                                                                                                                                                                                                                                                                            AAQ72297 is a cDNA isolated from the human adenomatous polyposis coli (APC) gene, it encodes the tumour repressors described in AAR63507 and AAR63508. Determination of alterations in APC or its expression

The gene for the protein is present on human chromosome 5q21 and is also referred to as adenomatous polyposis coli gene. It is a tumour suppressor gene, and mutations in this gene have been associated with tumourigenesis in retinoblastoma and colorectal tumours, and especially familial adenomatous polyposis (FAP) and Gardner's Syndrome (GS). The protein can be used in therapy to replace lack of native functional protein and the nucleic acids can be used for gene therapy. The nucleic acids that encode them can also be used as probes and primers in detection of the cancers and predisposition to it.

Adenomatous polyposis coli protein - useful in the treatment of PT cancers associated with mutation(s) on human chromosome 5q21

XX

Disclosure; Column 63-78; 102pp; English.

XX

This sequence represents a human familial adenomatous polyposis coli (APC) protein isolated from 87 cDNA clones. The gene for the protein isolated from 87 cDNA clones. The gene for the protein isolated thome on the sequence of the protein isolated the protein isolated from 87 cDNA clones. The gene for the protein isolated to human chromosome 5q21 and is also referred to as adenomatous cc polyposis coli gene. It is a tumour suppressor gene, and mutations in this gene have been associated with tumourigenesis in reflinoblastoma and cc colorectal tumours, and especially familial adenomatous polyposis (RAP) cc and Gardner's Syndrome (CS). The protein can be used in therapy to cc replace lack of native functional protein and the nucleic acids can be cc used as probes and primers in detection of the cancers and predisposition XX

Polyposis Coli (APC) protein in a sample. The method involves
contacting the sample with antibodies which specifically binds to the
2843 amino acid form of the human APC protein, or to a mutant APC
2843 amino acid form of the human APC protein, or to a mutant APC
protein, and detecting an APC-antibody complex. Mutations in the APC
gene play a role in tumorigenesis, indicating that it is a tumour
cappears of gene. It is located on chromosome 5421, which corresponds to
the FAP (familial adenomatous polyposis) locus. FAP is an autosomal
dominant inherited disease in which affected individuals develop
thundreds to thousands of adenomatous polypos in the colon and rectum,
some of which progress to malignancy. The FAP locus is often found to
be deleted in sporadic (i.e., non-familial) adenomas and carcinomas, and
chromosome 5 deletions have also been observed in tumours of the lung,
chromosome 5 deletions have also been observed in tumours of the lung,
and in leukaemias and lymphomas. Although the FAP locus contains
and in leukaemias and lymphomas. Although the FAP locus contains
chromosome for the genes such as FER, TBI, TB2, and MCC, it is thought that
mutations in the APC gene play a key role in the development of FAP and
sporadic tumours. The method is useful for detecting APC protein and its
mutant forms in forest lissue, placental tissue, aminotic fluid, blood,
comment forms in the APC and more approach to a such as the method is useful form served.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     serum or a tumour sample. The method is useful for diagnosing or prognosing neoplastic tissue, for detecting a genetic predisposition to cancer, for detecting germline and somatic alteration of wild-type APC genes, and for testing therapeutic agents for the ability to suppress tumours. The present sequence represents a 2843 amino acid splice variant of the human APC protein. This variant is more abundant than the 2742 amino acid variant (AAB23012).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                : | ::: | : :: | | : :| gkqsfsfskssggpqkaatck 1250

This sequence represents a human APC protein which is used in a method of identifying candidate drugs for use in familial adenomatous polyposis (C fAP) patients, or patients with increased risk of developing cancer. The protein can also be used to determine the presence or absence in a cell of wild type adenomatous polyposis coll (APC) gene or a downstream protein in the APC transcription regulatory pathway. This method involves introducing a Tcf-responsive reporter gene into the cell, and measuring cranscription of the reporter gene where a cell which supports active transcription of the reporter gene where a cell which supports active transcription of the reporter gene does not have wild type APC or a downstream protein of the APC transcription regulatory pathway. The converted of being neoplastic and for treating a patient with colorectal cancer or other cancer associated with FAPC, comprising administering to the patient a polypeptide comprising a portion of the APC sequence, comprising the beta-catenin binding site.

```
associated with APC or beta-catenin mutations. Human Tcf-4E protein expressed in colorectal epithelium transactivates transcription when associated with beta-catenin. Adenomatous polyposis coli (APC) regulates this transcriptional activation, at least in part by binding to beta-catenin. Determining wild-type APC protein for diagnosing cancer comprises introducing a Tcf responsive reporter gene having upstream sequences of c-MTC into a cell and measuring transcription of the reporter gene. The candidate drug identified is useful for treating familial adenomatous polyposis patients with APC or beta-catenin mutations and patients with increased risk of developing cancers such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human Tcf-4E protein; transcription factor; beta-catenin; Adenomatous polyposis coli; APC; transcriptional activation; Tcf responsive reporter gene; APC transcription regulatory pathway; familial adenomatous polyposis; FAP; cancer; colorectal; thyroid; brain; medulloblastoma; breast; head; neck; desmoid tumour; osteoma;

The invention relates to human Tcf-4 proteins and their corresponding CDNA molecules which encodes transcriptional activation factors of human Tcf/Lef family. Human Tcf-4 binds to beta-catenin and activates transcription in colorectal epithelial cells. Moreover it has been found that adenomatous polyposis coli (APC) regulates this transcriptional activation, by binding to beta-catenin. The invention also provides a recombinant adenovirus, Ad-Mini-Me le., APC Minus its aminor and carboxyl terminal Ends which expresses a fusion protein, green fluorescent protein (GFP)/CAPC containing GFP fused to the central third of APC which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            contains its beta-catenin binding domain useful for inducing apoptosis or treating colorectal cancer. These fusion proteins are useful for treating colorectal cancer, and other cancers associated with cancer, e.g. colorectal cancer, and other cancers associated with Familial Adenomatous Polyposis (FAP) or patients with increased risk of developing cancer. Human Tof-4 cDNA provides an excellent system for screening agents for their ability to promote delivery, integration, hybridization, expression, replication or integration in cells or in an animal. It also provides methods for diagnosis cancer in a sample

                                                                                                                                                                                                                                                                                                                                         This sequence represents the wild type human adenomatous polyposis coli (APC) protein. This sequence, and the APC peptide fragments represented by AAWI1923 wil1929 can be used in the method of the invention. The method of the invention is for the detection of abnormal APC, using antibodies directed against this sequence, or one of the partial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1088 kfqphfg-----qqecvspy---rsrgangsetnrvgsnhginqnvsqslcqe- 1132

```
The present sequence represents a human transcriptional regulatory factor containing a bromo domain. The factor interacts with proteins involved in the chromatin-mediated transcription regulatory mechanism. It binds to hSNF2H, hSNF2L and NCOA-62/Skip. It can be used for screening compounds binding to it and acting as agonists or antagonists, which are potentially useful for the treatment and prevention of cancer and other cell proliferation disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Indels 865; Gaps 108;

The factor interacts with proteins involved in the chromatin-mediated transcription regulatory mechanism. It binds to hSNF2H, hSNF2L and NCoA-62/Skip. It can be used for screening compounds binding to it and acting as agonists or antagonists, which are potentially useful for the treatment and prevention of cancer and other cell proliferation disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   97 SPVDHDSLESKRPRLEQVSDSHFQRVSAAVLPLVHPLPEGLRASADAKKDPAFGGKHEAP 156

It has a pulpage activity and is capable of activating transcription. SRCAP polypeptides are useful for activating transcription in a cell, for enhancing CREB (CAMP requiatory element) binding protein (GBP) mediated activation of transcription in a cell, for treating a patient having a disease involving a function such as insufficient transcription of a gene, e.g. a gene mediated by CBP co-activation, DEAD box RNA dependent helicase, adenoviral DBP protein, beta-actin or a nuclear receptor affected by SRCAP protein. Compounds that modulate SRCAP function, such as antibodies, antisense molecules, polynuclectides or ribozymes, are useful for treating diseases mediated by SRCAP-activated transcription, for example, infection by adenovirus, hepatitis C virus, human immunodeficiency virus type-1, Epstein Barr virus, cytomegalovirus or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             present sequence is an Snf2 related CREB (cAMP regulatory element)

                                                                                                                                                                                                                                                      This protein sequence is as the sequence given in AAR23962 except that Ala at position 2460 is replaced by Val.

This protein specifically binds to the enhancer of the alpha-fetoprotein gene. The DNA encoding this protein may be useful for the prodn. of biologically active proteins by inscrting the DNA into an expression vector and co-transfecting animal cells with another expression vector in which a gene for the biologically active protein is placed under the control of alpha-fetoprotein gene enhancer and

```
This protein specifically binds to the enhancer of the alpha-
fetoprotein gene. The DNA encoding this protein may be useful for
the prodn. of biologically active proteins by inserting the DNA into
an expression vector and co-transfecting animal cells with another
expression vector in which a gene for the biologically active protein
is placed under the control of alpha-fetoprotein gene enhancer and
promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         391 avpd-rdgnsnleeagk--gpetsedlgknilpsastegsgdlkpspadpgsvredsgfi 447

Its amino acid sequence was deduced from an isolated nucleic acid molecule (see AAV02302). The SSECKS nucleic acid, as well as homologous and hybridising nucleic acids are claimed, as are isolated proteins encoded by such nucleic acids, vectors comprising the nucleic acids, host cells, and methods of inhibiting the expression of a transformed phenotype in a host cell inhibiting the nucleic acids. Introduction of a SSECKS nucleic acid or gene product into a host cell inhibits mitosis of the host cell, allowing the treatment of diseases associated with disorders of proliferation and/or with the expression of a malignant phenotype. SSECKS can also be used to treat or identify disorders of cytoskeletal structure and cellular architecture (such as Alzheimer's disease), and may be a marker for aberrancies in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        50 klpqkngqlssvngvaeggdvhvqeenqegqeeevvdedvgqresedvr---ekdrvee 105
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  306 KICQRYDQLME----AWEKKVDRIENNPRRKAKESKTREYYEKQFPEIRKQREQQERFQR 361
